Wittur Announces Test Tower, Plant Expansion, Book

Wittur has announced a new test tower at its production facility in Zaragoza, Spain; completion of a plant expansion in Krupina, Slovakia; and publication of a book.

Completion of the test tower was slated for March. The 30-m-tall, eight-stop tower will be able to house two complete 2500-kg elevators. It will be used to develop components and complete Wittur elevator systems.

Expansion of Wittur's production facility in Krupina, Slovakia, begun in late 2013, is now complete. It included a complete redesign of the interior and the addition of steel and paint production lines. The facility now covers 8,000 m². Wittur calls it "an important investment that offers Wittur increased production capability for its best-selling products."

Finally, Wittur has released a book celebrating and illustrating how elevators can be an integral part, or even the focal point, of a building's design. *LIFTISMORE: Histories of Lifts and Architects in a Vertical World* may be viewed online at
