Lift controller 32 bit system

Directory

Directory

1. F5021 Main board

Product characteristics

- 32bit processor ARM7 industrial standard

- Doubble-processor-architektur for extended security needs

- 2x CAN interfaces separate for internal and external communication

- high EMV-stability (EFT-4000V)

- high ESD- stability (ESD 8000V)

- certified for EN81, GB7588, CE
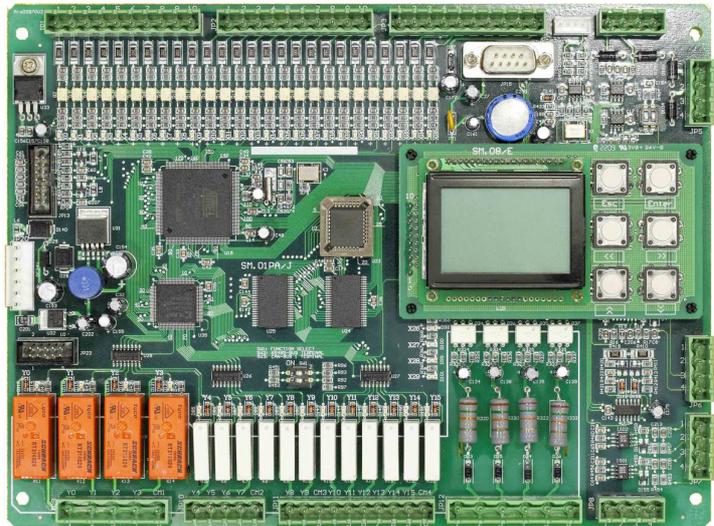

Functionallity area

- For rope- and hydraulik-lifts

- A lot of functions possible to parametize for nearly all kinds of lifts.

- Lifts from 0,63m/s to 4m/s.

- Up to 64stops, also with selective door controlling

- Replace the 16bit-board F2021 (longtime supply with replacement parts is secured)

- Analoge or digital triggering of the frequency inverter respectively chopper.

- Shaftdetection via incremental shaft encoder (RS422, HTL, SSI)

- Duplex groupe function integrated, possible to exted up to group times 8

- Weight compensation at start-up with according weight measuring system.

- ID-card system (credit card -transponder) possible to integrate.

- Remote control locally and globally

- Graphical LCD direct on board or a separate controller.

- Description of Drive cycle, on- and off- activities, status information etc.

- Error information memory (20 digits) with real-time coverage and full text advice.

- As standard are 2 cabine doors, possible to expand for 3 doors.

- Lot of special features, e.g. automatical evacuation with choose of direction conditioned to the weight.

2.System overview

SmartCom is a modern, based on newest technology controller system, especially for elevators.
The system basically composed of following components:

- Main module SM01
- Car module SM02
- Command-module SM03
- Floor module SM04
- Expansion module SM09

Different variations of the serveral modules make the best and optimized adjustment of the controller system possible for the respective lift and the requested functionallity area.

Based on the never changing CAN-journal its possible to realize controller for simple and complex lifts.

All components are, due to the CAN-systems, nearly in any order possible to be combined, and after all possible to be extended.

Main module SM01

The main module is in the Controlcabinet and is the heart of the controller. It contains all functions, especially trigging the handler, recognitize the possition of the lift and lots of special features, which are normally directed to the shaft and the engine room. It is communicating with the other modules via CAN-Bus.

Car module SM02

All functions, which are directed to the car, are done by the car module. It is linked via CAN with the main module.

There are two possible options, the „classic" with only one module SM02/03, and from now on the, with 32bit Board F5021 established „spreaded" option. In this case there are each a SM02/H in the Inspection box and a SM02/G in the car operation panel (COP) used. Due to this, the till now needed 36pin cable from the Inspection box to the COP, is reduced to a maximum of 12 pins. Now the connection for up to 3 cabinet tableas (2nd door side, console panel via CAN is really easy.

Command-module SM03

This module is connected with the cabinet module. It is possible to connect 8 of these modules with one SM02. One command module allocate 8 entrances for inside commands and 8 outputs for the respective indication.

Floor module SM04

Modules of this kind of art can be used as well as floor display in the car or as floor module with floor display and driving display at the floors. The addressing is really simple without any tools, by settings via the floor push buttons or via the DIL-switches.

The SM04 is available in different forms: horizontal, vertikal and vertikal slim. The Displays are different in their kind of art and coverage and it is also possible to be manufactered client-specific. They are all communicating via CAN-Bus and can be teamed together nearly in any order.
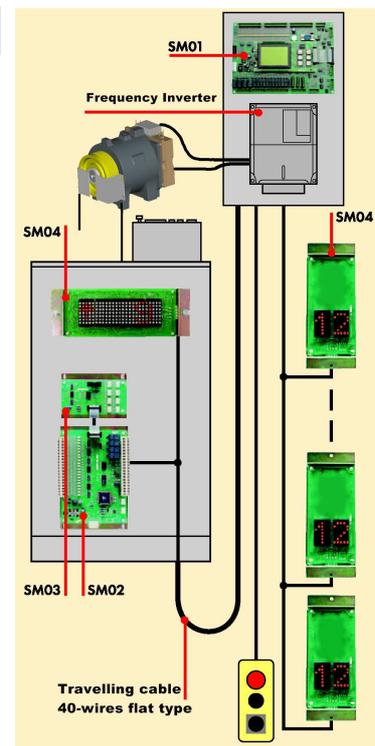

At the floors, the Exterior call buttons and key buttons will be conected with the AM04 modules (Display + CAN-module) for special features. Newer modules also allow the conection of a speaker to make possible the, in EN81-70 required, „tones".

Extra module SM09

Via this module client specific special features can be complemented without changing the central module. For example the conection to lift-maintenance-systems of the client or additional alerts, etc.

Function overview

Standardfunktionen		
1	Collectioncontrolling	Collecting hall calls with respect on the given direction
2	Inspection Drive	Manual drive up and down. Within the area of doors, the door open button can be used for opening the door.
3	Self liberation with slow drive	In case of missing the door area within the normal mode, the lift is driving slowly with closed safets circuit into flush position and open the door.
4	Test dive	For Testcases, the lift can do a indicated number of accidentally test drives.
5	Real time clock	Errors are registred with date and time. Time-dependent funktions can be activated.
6	Time to keep doors open	Dependent of the kind of call(interior, exterior, service, special call), the time to deep doors open can be indicated.
7	Door opening by lokal call	Is the lift allready in the floor from which the call comes, the door opens. With the Door open button, the door can be keept in open position
8	Early door closing	With the Close door button, the door can be closed, earlier than the keep door open time frame.
9	Forced opening of doors	Inside the door area, with the Door open botten, the door opening can be forced for closed doors or doors which are actually close.
10	Controlling of door closing. (return motion automatic)	In case the bar is not closed within 15 sec. after arrival at the door-close-endswitch, the door open again for a new try.
11	Controlling of door opening	In case that 15 seconds after the door opened and the door-opend-endswitch is not activated, the door is closing until further command.
12	Call cancel	By doubble-pushing a call button, the call is canceled.
13	Terminal stops	At paramount stage the up command gets canceled, at the lowermost stage the down command gets canceled.
14	Direct drive	Direct drive without rat run. This function is activated at standard when incremental detection and analog trigger of the inverter. The driving cycle is preset by the controller. There are no special demands on the inverter.
15	Cabinet full	If full load, the cabinet do not stop anymore for hall calls.
16	Cabinet light cut off	After 5 minutes without any activity, the cabinet light will be switched off.
17	Park drive	After an indicated time without any activity, the lift drives to the main purchase postion.
18	LCD controller	Graphical display with comprehensive status informations and menu navigation.
19	Analoge speed control	The rotation speed of the frequency inverter is triggered by the analog output
20	Digitale speed control	Alternatively the speed can be controlled via contactors
21	Error memory	The last 20 Errors get saved and displayed with information of time,

		floor and error code.
22	Learn trip for schaft information	The controller is learning with encoders and floor flags the bulk of the schaft and stopping distance. After that, the lift can merge into standard mode.
23	Floor approval	Free adjustments of floors, which can be departed.
24	Adjustment of the floor display	The icons, which should appear in the respective floors, can be free adjusted to a large extent.
25	Liftboy control	The lift gets drived via interior control manually. Hall calls will be served.
26	Priority inside	Hall calls are deactivated only interior calls are effective. The door must be closed with the door-close-button. The Push-button have to be compressed until the close-door-end-switch is activated.
27	LED-dot matrix-display, LCD graphic-display	At every stop there ist a dot matrix display with floor update, direction and status. The user can see that there is something going on.
28	Display with roll function	Respectively to the drive direction, the display is „rolling".
29	Automatic schaft data correction	Continously the schaft datas gets corrected
30	Remote off	The lift can be shut down, but before all still open cabinet commands need to be completed.
31	Door only opens inside the door areas	Outside the door areas, the cabinet doors can not be opened.
32	Safty light barrier/ light gate	The safty light barrier/ light gate gets evaluated by the controller. In case of activation, the controller avoids closing the door.
33	Overload	In case of overload, the door stay open and an alert sounds (buzzer)
34	Abuse recognition	If the cabinet is empty (empty load) the number of cabinet calls is bordered.
35	Stop in case of wrong agitator direction	In case the controller recognize a wrong agitator direction the handler gets stopped.
36	Drive inspection (skidding)	If the cabinet is not moving despite active handler, the handler gets stopped after 40 seconds (drive inspection). New drives only possible after Reset.
37	Inspection of traction	In case of cabinet is moven despite deadlock, alarm get raised.
38	Inspections end switch	The inspections end switch avoid, that the lift drives to the emergency limit switch during inspections, return motion drives or learn trip.
39	Contactor monitoring	The controller check at every drive the correct functionallity of the main contactors and brake contactor .
40	Speed monitoring	If over speed is detected an emergency stop will be effected
41	CPU monitoring	The processor is monitored by watchdog, if needed restarted.
Optionale functions		
1	preopening doors	Using safty circuit
2	relevelling with open doors	Using safty circuit. At hydraulic lifts standard function
3	Fire controll	In case of fire signal the lift drive to the fire floor and stay there with open door.
4	Fireman control	All commands get canceled and the lift drives to the fire floor stage. Now the firemen can use the lift. The door is not open atuomatically, but have to be opened with the door-open-button. Unhand the button makes the doors closing immediatelly. European (EN81) und Russian (PUBEL) variant.
5	Additional COP	It is easy to install a second car operation panel
6	COP for 2nd door	Selective door control
7	Disabled COP	Particular COP (e.g. desk COP) for disabled people (longer door opening times)
8	Duplex-function	Via the second CAN-Bus 2 lifts can be conectetd to a two- groupe. The

		lifts than parting calls respective to the actual situation; so it can be achieved that the times of waiting can be reduced to a minimum. In addition there can be activated a function, that, if there are no more open calls, the one of the lifts which is nearer the main stop position, gets driven there an keep it prepared there.
9	Group function	With a optional group controler board, lift groups with up to 8 lifts can be realized. The group control collects the hall calls and allocate these respectivlly to the condition of the several lifts in order to reach short time of waiting.
10	Rush hour handling – fill up building	Via internal time frame inputs, the capacity can be adapted to the building. (type office buildings)
11	Rush hour handling – clear building	Via internal time frame inputs, the capacity can be adapted to the building. (type office buildings)
12	Distribution of waiting lifts	If there are no more open calls, the lifts of the groupe get distributed after 1 min. in the buildding, means one drives to main stop position, the others disperse themself, in order to achieve shorte waiting times.
13	Interface to building control service engineering	RS485 interface for connection to a PC of the building control service engineering.
14	Remote control	The lift can be integrated into a region comprehensive remote control system.
15	Lift arrival gong	During the drive in, the gong on the cabin roof or under the cabin floor, about the arrival of the lift.
16	direction indicator HOP	Inside the exterior panels it is possible to instal an optical and akustical continued travel display.
17	Floor gong	For every stop an lift arrival gong can be arranged.
18	Card reader in the cabin	With a transponder card, either a specific call can be activated or defined calls can be approved.
19	Card reader at the floor	Approval of exterior calls
20	Selective door triggering	Frontside and backside of the lift can be controlled seperatly.
21	Scramble	After one minute the door is closing slowling despite of the safty light barrier.
22	VIP Service	A key switch in exterior panels cancels all hall calls and fetches the empty cabin. Now multiple interior calls can be done. After these calls are done, the lift change back to standard handling.
23	PIN entry via Push buttons	For certain floor approvals the Push buttons can be used for entering a PIN.
24	Local controlled floor approval	For several and duplex lifts a changed floor approval via key switch can be activated.
25	Via group controlled floor approval	Floor approvals can be temporary changed via the group add-on.
26	Temporary block of sereral floors	Temporary, the user can block floors
27	Automatic evakuation	In case of black out with following auxiliary power supply, the cabine will be driven to the next stop.
28	Auxiliary power supply evakuation	For lift groups an evakuation will be done separate one after another
29	Earthquake function	Lift get stopped during the drive and will be driven to the evaktuaion stop.
30	Voice message	Serial and parallel access for voice message

3. Operation equipment

Overview of push button functions:

⬆	Next parameter/ menu item
	Increase the number of selected decimal
⬇	Former parameter/ menu item
	Decrease the number of selected decimal
⬅	Jump 10 parameters back,
	one decimal place to the left
➡	Jump 10 parameters forward,
	one decimal place to the right
ENTER	Access parameter menu
	parameter set/adopt
ESC	Parameter/menu item leaving
F1 2x F1 3x F1	Hot key: change from status-window to error display, to encoder diagnostic and to CAN-diagnostic
F2 2x F2	Hot key: change to call entry and to status display of in-/outputs.
F3	Hot key: to travel cycle display
All functions from F1 to F3 also accessable via the menu!	

D1:driving
D2: up
D3: down
D4: error

Floor or
error code

LCD
with status
Menu, etc.

keypad

CAN

RS485

Optional a control element can be directly inserted on board F5021B, or the external control element can be connected with a special cable with the 9pin Sub-D-linkage JP15. The USB-plug of the cable have to be pluged in the left plug (RS485). A plug-in into the right plub by mistake arose no claims, the control element is just not working.

Attention! Never use the special cable to link with the PC. The PC can be damaged!

Again Attention!

The inserted control element and the external control element may not be connected at the same time! In case this occurs, there won´t be any damage, but the parameter are not possible to be setted because two control elements at one time are not allowed to access the parameter memory!

Handling:

The handling via the inserted control element and the external control element are identical. The external control element processes additionally to the shortcuts F1, F2 and F3 whereby assinged diagnostic-windows directly can be recalled. At the inserted control element all windows only accessable via the menu.
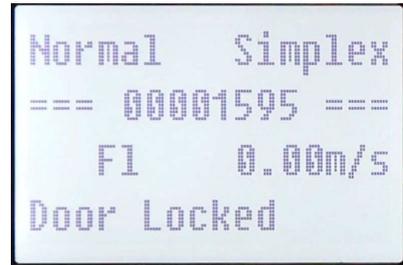

Start window

Log-in:

In order to see the status and for setting parameters, first you have to log-in. In case you are not logged in yet, it is displayed after pushing the ENTER button the window for log-in. By default the password is „1234". After log-in it is possible to change this in „Chg.Password". Attention! Do not forget the password!. The controller can without password only in the factory be unlocked!

Log-in

Menu

The complete menu tree you can find in: "Menu tree & parameter".

The start window shows mode, group status, journey counter, floor, speed and the actual activity. With Enter you can change to the main menu. Repushing Enter show you the monitor-menu auf, which occupies all diagnostic windows.
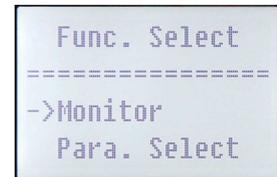

Main menu

Status window in Submenu „Monitor"

Run State is the start window.

In the first line you can see the mode (Normal, Inspection, Fire Return, Firemen, Park) and the group status (Simplex, Group).

Among the journey counter, floor, speed and actual activity.
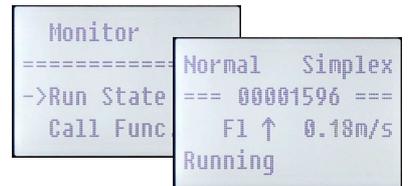

In Call. Func. are displayed the actuall calls and it is also possible to enter calls (with the arrow buttons on the respective call and Enter).

Cabin call, hall calls for up and down.
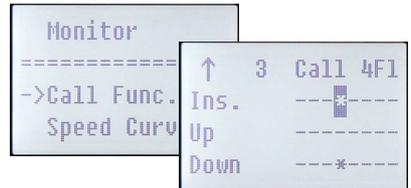

Speed Curve is the graphical display of the as-is-value (of the encoder) of the speed.

Above it is displayed the actual speed value and the time of journey.
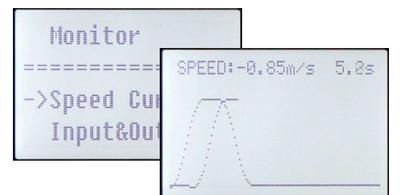

At the window Input&Output it is possible to display all outputs and inputs. With the up/down-buttons you can switch between the several 16fold groups. With the right/left-buttons a single input/output can be marked. Than in the line among is shown the function of the input/output.

The marking X (inputs SM01) and Y (outputs SM01), also TX (inputs SM02) and TY (outputs SM02) you can find again in the diagram.
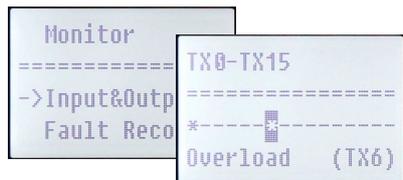

In the error memory (Fault Record) there are displayed the last 20 errors with date, time and floor.

The latest error is displayed at first.

With up/down you can move between the items in the list. With Enter an additional window pops up, in which date, time and full-text-error message is displayed.

```
Monito  ┌──────────────┐
=======│ Number     1 │
->Fault │ Erroe Code 6 │
   Shaft│ Floor      3 │
         │ Time  ┌─────────────────┐
         └───────│    Err Info     │
                 │=================│
                 │ Can't Close Door│
                 │ 09-11-18 16:49  │
                 └─────────────────┘
```
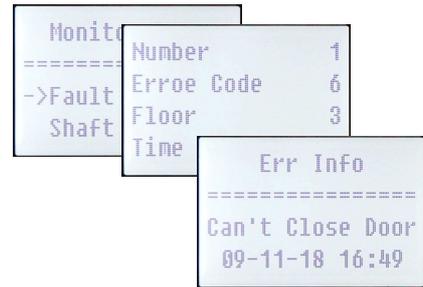

The list Shaft Data contains the floor postions in mm which were identified at the learn trip. If there are problems in the shaft selection you can really fast identify if the floors were learned correctly.

```
┌ Monitor ──────────────┐
=============│ Floor    Data│
->Shaft Data │   1        0 │
   Encoder   │   2     2897 │
             │   3     5690 │
             └──────────────┘
```

The two windows Encoder Eva and Communication are helpful if you have problems with the encoder or the CAN-bus.

```
Moni │<<Enco┌─────────────────┐
=====│timely│ << CAN Bus Status >>│
     │min:  │                 │
->Enco│max:  │ Ovr Tec Rec TxBo│
 Comm │max-mi│  0   0   0   0  │
      │AddIn:│ Ovr Tec Rec TxBo│
      │Warnin│  0  128  0   0  │
              └─────────────────┘
```
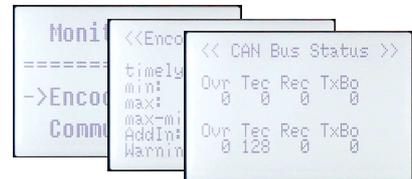

In the version window are shown date and version number of the firmware. Before doing an update it should be checked if the new software is really more active than the allready existing version.

```
┌ Monitor ──────────────┐
=============│     Version     │
->Version    │=================│
             │ Nov 10 2009     │
             │ N01F3Q01.61.GE  │
             └─────────────────┘
```
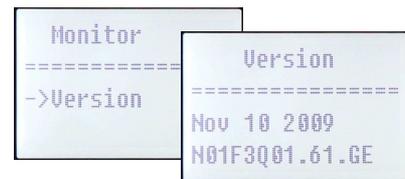

Parameter setting in the sub menu Para.Select

Via the parameter menu you can access to the numerous parameters. There are parameter groups, in which the parameters combined thematically (e.g. engine or door parameter), as well as a list in which all parameters are sorted by numbers.

```
┌ Para. Select ──┐
=================
->Main Para.
   Insp. Option
```

Most of the parameters can only be setted in the inspection or return motion mode. If the alert window shows up, switch to inspection.

```
┌──── Error ─────┐
=================
 To Insp. Mode
 Down Select
```

All parameter are achived as 16bit integer. Most of them are shown as decimal, with adjustment value (e.g. means the value 50 at a device of 0,1s a parameter value of 5 seconds).

```
┌ Para. Select ──┐
=================
 F24 =    0
 Drive Mode
```

Some parameters are available as bitmask. Indeed is shown the decimal, at once you want to set the value, it will be shown as bitmask and you can set it with right/left button (move between the bits) and up/down button (* means setted/ - means canceled).
In the line below shows up the description of the bit.
Thus you can configure e.g. for every several input the logic (*NC/-NO)

```
X0-X15
================
*----[ ]****-*----
Up Limit   (X5)
```

Lvl.Mic.Adj. allows you the correction of serverl precisions in all floors. Normally this is not necessary as the floors get messured at the learn trip.

```
Para. Select
================
->Lvl. Mic.    Lvl.Micro Adj
  Multi Spe   ================
                  2     20
              Flr.  Lvl.M Adj
```

Multi Speed contains all parameters, which are necessary for the handling of the frequency inverters in multistep-mode (prallel control).

Door Control allows you to set parameter for the lift-door-control.

```
Para. Select
================
->Multi Speed
  Door Control
```

Flr.Disp. Guides you to the list with floor displays. For every floor it is possible to do the settings for the displayed letter-combination. (at Step SM04 displays). At the same time, the display code configure the voice message, which get annoced at the respective floor when lift drives in.
The display codes are configured in a table in the attachment.

```
Para. Select
================
->Flr. Disp.
  Service Flr.
```

Service Floor configure the floors, which are approved. Furthermore floors can be configured, which are only can be unblocked via key-switch.

Block Floor allow the locking of a floor by time or key-switch.

```
Para. Select
================
->Service Flr.
  Block Flr.
```

Comp. Stop (forced stop) define stops, at which the lift by passing enforced stops. In some cases it make sence for hotels.

Heavy Traf. Allows the configuration of the function fill-up building and clear building. By this, especially for office buildings, it is possible to improve the hoisting capacity.

```
Para. Select
================
->Comp. Stop
  Heavy Traf.
```

In Test Run it is possible to configure the parameter F34 to a number of journeys, the lift have to do test journeay without any commands (accidentially).

Para. Setup is the access to the complete parameter list.

```
Para. Select
================
->Test Run
  Para. Setup
```

Reset restores all parameters to factory setting. This should only be done if absolutely necessary. Before Reset there have to be entered a number in order to avoid to do a reset by mistake.

Attention! After entry of the number the reset of all parameters starts without any further query!

F146 necessarily have to be setted to "0"!

```
 Para. Select
========
->Reset    Reset        ct
           ================
           Pls. Input: 5678

                Reset Clew
                ================
                Reset
                Reset Success!
```
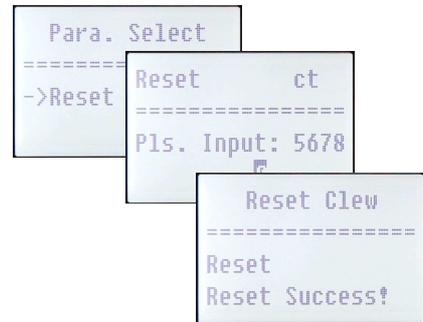

Different functions (Func.Select)

Time Setup: Configuration of the real time clock. This is used for Error recording and the time relevant floor approvals and the functions fill-up building and clear building.

```
 Func. Select
============
->Time Setup    Time Setup
 Door Teach    ================
                09Y 11M 18D
                  17:27:06
```
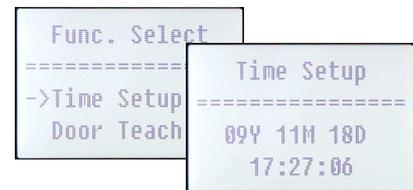

Door Teach: Detect by opening and closing the function of the door-end-switches.

```
 Func. Select
================
->Door Teach
 Shaft Teach
```
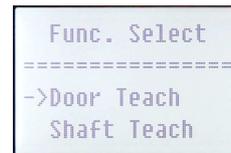

Shaft Teach:learn trip, have to be done before switch to standard mode (after installation or change of door positions).
Door, bus, shaft selection and cabine light have to operate correctly.
After activation of the learn trip, the lift is driving self-consistent to the lowermost stop and starts the learn trip. As soon as the learn trip is finished, the lift can be switched to standard mode. If an Error occours, the learn trip is stopped with an error message.

```
 Func. Select
================
->Shaft Teach
 Reset Para.F
```
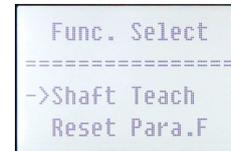

Reset Para.F: Restore to factory setting!!!

Reset Errco.: Clearance of the error memory!

```
 Func. Select
================
->Reset Para  Reset Para.Fct
 Reset Errc   ================
              Pls. Input: 5678
```
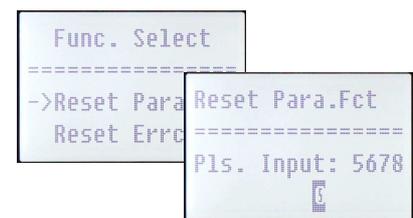

Error Reset: Reset after Lift Error (fatal error) as e.g. drive monitoring, contactor monitoring, brake monitoring, etc.

Relogin: Log out and if so new log in. Normally after 10 minutes without operation the log out is automatically.

Chg.Password: Changing password. Attention! Do not forget password! Only possible to can be restored without password in the factory!

```
 Func. Select
======   Func. Select
->Errc  ======   Func. Select
 Relo  ->Relog  ================
       Chg.P    ->Chg.Password
```
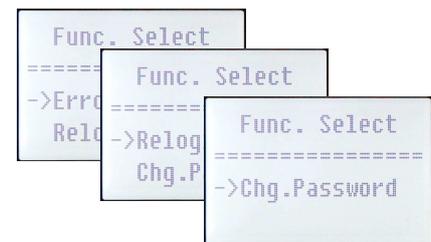

4.Menu tree & parameter

Func.Select	Monitor	Run State	Status of the lift (Floor, speed,. etc.)
		Call Func.F	Enter and display calls A-Side
		Call Func.B	Enter and display calls B-Side
		Speed Curve	Graphical display of the speed curve
		Input&Output	Status of the inputs and outputs
		Fault Record	Error memory
		Shaft Data	List of floor values
		Encoder	Analysis of encoder
		Pos.Monit1	Position analysis 1
		Pos.Monit2	Position analysis 2
		Communicat.	Analysis of CAN-system
		Version	Display of software version
	Para.Select	Main Para.	Basic parameter
		Insp.Option	Inpection parameter
		S-Curve	Travel cycle parameter
		Lvl.Mic.Adj	Fine adjustment precision
		Multi Speed	Parameter for multistep operation
		Door Control	Door-parameter
		Flr.Disp.	Adjustment of floor display
		Service Flr.	Floor approval
		Block Flr.	Floor blocking (access control)
		Comp.Stop	Define forced stops
		Heavy Traf.	Fill-up building/ clear building
		Test Run	Number of accidential test drives
		Para.Setup	All parameters in one list
		Reset	Restore to factory setting!
	Func.Select	Time Setup	Configure time
		Door Teach	Learns door-end-switches
		Shaft Teach	learn trip shaft
		Up. Lmt Test	Measurement drive top limit switch
		Dn. Lmt Test	Measurement drive bottom limit switch
		Dnload to OP	Download Parameters to ext. Handterminal (*1)
		Upload to MB	Upload back to the motherboard SM01 (*1)

	Reset Para.F	Parameter to factory setting
	Reset Errco.	Reset Error memory
	Reset Times	Time Reset
	Reset In&Out	Reset of the Input-Output- functions
	X Input	Function of X inputs
	TX Input	Function of TX inputs
	EX Input	Function of EX inputs
	Y Output	Function of Y outputs
	TY Output	Function of TY outputs
	EY Output	Function of EY outputs
	Valid Period	Term limit

Error Reset	Reset from error mode
Relogin	Again log-in
Chg.Password	Password change

(*1) only with ext. handunit

Basic-parameter (Main Para.)

No.	*Standard*	*Description*	*Advise*
F6	1m/s	Nominal speed lift	
F7	1450rpm	Nominal rotation speed engine	
F8	1024ppr	Encoder pulses	
F24	1	Trigger of FU analog	
F11	18	Number of floors	
F182	1	Number of delay switches	
F60	3	motor contactors : 3= K1 and K2 after the inverter and monitored	
F36	0	Break-monitoring-switch, 0= no monitoring	
F153	0	Door lock det. type	
F156	1	Safety loop type	
F62	32	Journey time monitoring. For test set to 2s.	
F204	1	Relevel Check	
F25	35296	Configureing, if the several inputs wired as closer (NO=normally open) or as opener (NC=normally closed).

Depends on the diagram and the conected switches | Bitmasks |
F26	83		
F27	835		
F28	0		
F23	0	Group function 0 : Simplex, or rather Duplex-master 1 : Duplex slave 2 : with group controller	

Inspection-parameter (Insp.Option)

No.	Value	Description	Advise
F201	0	at 1 it is possible to drive above the reference-journey-end-switch	For test purpose
F200	0	Distance for early stop at paramount stop (headgear)	mostly UK
F40		Top Access Dis.	
F42		Bot.Access Dis.	
F64	1	0= no door operation for inspection	
F165	Bit 1=0	Bit 1 avoid movements of door at inspection (door B)	

Travel cycle parameter (S-Curve)

No.	Value	Description	Advise
F0	0,55m/s²	Acceleration	
F1	0,55m/s²	Deceleration	
F2	1,3s	Rounding at start	
F3	1,1s	Rounding at the change to constant drive	
F4	1,1s	Rounding at leaving of constant drive	
F5	1,3s	Rounding at stopping	
F12	0,25m/s	Inspection speed VI	
F13	0,06m/s	Levelling speed VN	
F48		Down Rev. Speed	
F183	0,8m/s	learn trip speed (for analog-trigger)	
F21	6mm	V0 stop distance	
F175	0,06m/s	Creep speed at start	
F186	0,5s	Time of creep speed at start	
F180	100,00%	Analog value at nominal speed (Vmax)

F232	730	Starting time for fill-up building: e.g. 730 means 7:30	
F233	930	Finish time for fill-up building: e.g. 930 means 9:30	
F234	1700	Starting time for clear building: z.B. 1700 means 17:00	
F235	1830	Finish time for clear building: z.B. 1830 means 18:30	

Special functions

No.	Value	Description	Advice

124	0	**Hall Priority:** The additional input of the SM04HRF (JP10.6) activates these function. If the input was activated during a drive of the lift, than this drive will be finished. After this drive the lift runs into the hall priority floor. The Lift controler cancels all calls and is now ready for the prioity user for one car call. Attention: car priority has got a higher priority!	Available since Software version: N01F3Q01.64.GE
	>0	**VIP or Penthousecontrol (Visitor control):** The additional input of the SM04HRF (JP10.6) activates these function. If the input was activated, the lift runs into the main floor (set in F22) and picks up the visitor after the waiting time wich is setable with F124 (F124>0). The visitor can cut the waiting time with pushing a car- floor- button or the door- close- button.	Available since Software version: N01F3Q01.64.GE
F204	1~10	**Relevel check:** The tolerance of the safety circuit is adjustable 1~10. The parameter F204 allows the safety circuit errors from 1~10 after the controller will block the lift with the error: Doorzone error. For technical control check set these parameter to „1".	Available since Software version: N01F3Q01.74.GE
F205	0 1 2 3	**Evacuation mode:** Evacuation dependent on the weight Evacuation in the nearest stop (independent of weight and direction) Evacuation in a defined floor (In parameter F206 adjust the evakuation floor) Evacuation direction depends on input (e.g. X21) If input X21=on → Eva direction down If input X21=off → Eva direction up	Available since Software version: N01F3Q01.74T2.GE N01F3Q01.76T2.GE
F207	1	**TAXI control:** If a hall call was given and the car is empty (TX7 Emptyload active), the lift runs to the floor. The lift is now arranged for this user. When the user is going into the car (Emptyload not active) the car is arranged for the user as long as Emptyload sensor is not active (as long as somebody is in the car). If during this time an another hallcall was given, these hall button light will go on and the call is stored in the controller. If the drive of the lift is finished, than the next hall call will get the lift. All hall calls will get the lift one by one (FIFO- principle). In case that somebody calls the lift but doesn´t go in the car, than the lift will go to the next call after the door is closed.	Available since Software version: N01F3Q01.74T2.GE
F209 F210		**Inspection move inside car (Austria flat drive):** The input TX18 of the SM02/C- car board activates this function. With this function it is possible that the lift drives automatically in down direction (in the lowest floor in up direction). The lift drives the distance (adjusted in F210). Range of the distance is between 0 and 500mm. In Parameter F209 the floors must be enable for this function. If in this floor are directly flats behind the shaft doors, than the technican can check from inside the car, the door lock of the shaft door. The car door is controllable with the door close- and the door open- button.	Available since Software version: N01F3Q01.75T4.GE

		Automatic limit switch measurement drive	Available since Software
		Automatic limit switch measurement drive Up.Lmt Test: The lift must be at the top floor. After the lift is levelled, the measurement drive can start. Inspection ON → Enter → Function Menu → Up. Lmt Test → Inspection OFF. The controller starts the mesurement drive in up direction, as long as the top limit switch brakes the safety loop. With the emergency operation the lift can be back into the door zone. In the menu → Pos.Monit1 → UpFinal Pos you can find the distance between top levelled position and the final limit switch. The menu point UpLimit shows the position of the top inspection limit switch. Dn.Lmt Test: Same procedure like the Up.Lmt Test, however the lift must starts from the lowest floor (levelled position). This positions are also shown in the menu Pos.Monit1.	Available since Software version: N01F3Q01.75T1.GE
F211 (F152)		**Energy saving function** With the parameter F211 it is possible to adjust the time when the controller will skip in the sleep mode. This time starts running after the carlight is switching off. (T sleepmode = Time in F152 + Time in F211). F211=0 → No sleepmode! Dureing the sleepmode all outputs are off and all inputs will be ignored of the SM02. (If the door controller is powerless, also the door limit switches will be no simulated) For wake up, push a hall or car call.	Available since Software version: N01F3Q01.76T1.GE

5.Shaft selection

The shaft selection consists of a incremental encoder and solenoid switches, respectiveley sensors.

The incremental encoder optinally is positioned on the engine or in the shaft.

Especially for rope lifts it is used the encoder of the engine, which can hand over at the most of the frequency inverters via encoder output (encoder simulation) to the controller.

In this case it is entered the effectiv datas for the parameters F6 (nominal speed), F7 (engine speed) and F8 (encoder release).

For slowly running synchronous motors it mostly have to be juggeled with the parameters nominal-rotation-speed and encounter-puls-rate. E.g. 150U/min at 2048ppr changed to 600U/min (*4) and 512 ppr.

If the encoder is assembled in the shaft (rotating string) for the nominal-rotation-speed have to be entered an equivalence-rotation-speed (equates encoder-rotation-speed).

For the system used by us with carbon cord show up the following values:

(F7)	0,8	1	1,2	1,4	1,6	m/s
(F8)	294	367	441	514	588	RPM

v	Distance (mm)	
	L KO	L KO1
0,63m/s:	950	
1,0m/s:	1300	
1,6m/s:	2400	
1,8m/s:	2600	
2,0m/s:	2400	3800
2,5m/s:	2400	5600
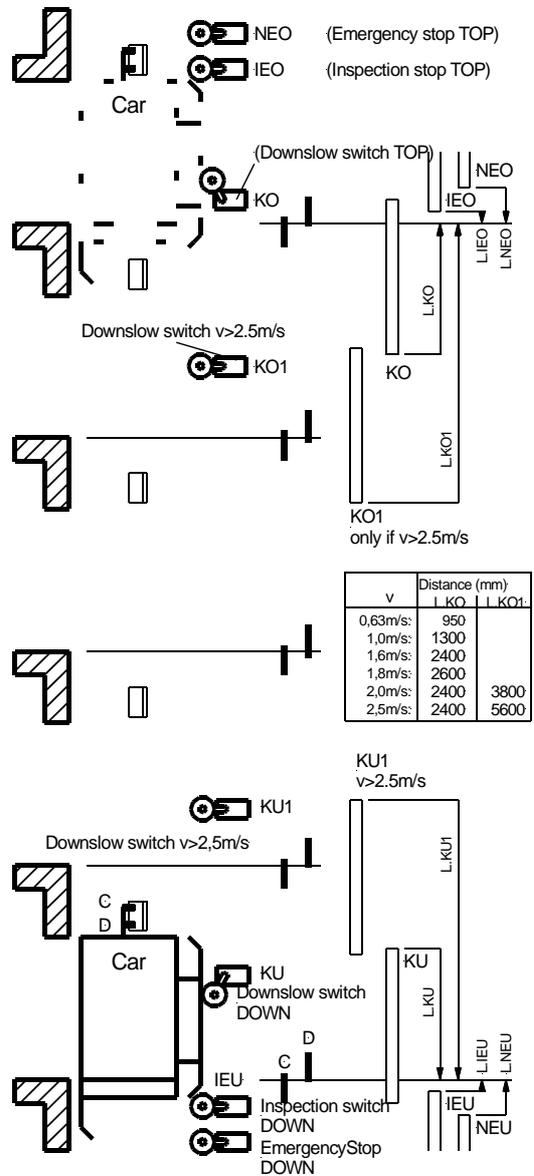

re-levelling sensors:

As the shaft selection is done with the engine encoder, the slip of the tractions sheave have to be
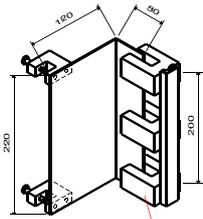

compensated. For this, there are in every floor re-levelling-plates installed with about 220mm length. (The length is not important, but it have to be identic in all floors).

This plate will be evaluated by two inductiv sensors C and D. C is the upper, D the lower.

Solenoid switch:
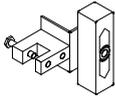

Additionally there are in the shaft ceiling and in the shaft pit each 2 bi-stable solenoid-switches (there could also be roller-switches with repective curves at the cabin). Correction above and below, as well as inspection-end above and below.

It is important, that the switches are installed as opener. By crossing the above correction- and inspection-switch they have to be open on the upper side and closed on the lower side. For the lower positioned ones, the same is valid respectively contrairiwise.

Correction switch

The correction switches serve the deceleration at the termian end stops in case of error (blackout of incremental encoder) and for learn trip. They are also used for correction of the incremental-encoder-datas. In the set of drawings, page 50 you can find these respectivly to the speed recommendet distances. The exact pitch for the braking distance which is choosen by the controller is not important, as this is assigned by the chossen parameters. However, braking distance and pitch should not have a bigger difference than 45cm.

Inspection end switch

The lower inspection end switch have to be installed in that way, that it opens right before the emergency limit switch is activated, but after the re-levelling-sensor D lower the precision plate is freed. C is mentionend in the plate.

For the upper inspection switch it is in the respective way, means IEO will be activated (open contact) if the sensor C is upper the precision plate and D is still at the plate. Also in this case the emergency limit switch should be a bit away, that the lift stops before the emergeny limit switch is activated.

The inspection end switches are important for the learn trip.

Intelligent magnetic sensors iMS45

Meanwhile, all above mentioned switches are integrated in one compact sensor-system. Due to this the montage and adjustments are made really easy.

The iMS45 have up to 4 solenoid sensors, which are together with a programm able analysis-electric can generate up to eight switching signals. For a complete shaft selection one iMS45-POS is enough. Especially for machineroomless an additonal iMS45-SPD sensor will be attached, which detect the speed and rotation of the driving wheel. This is displayed at the Drive monitor, which is the display and analysis unit.
The sending of datas itself will be done via a serial conection without malfunction rate RS485-connection.

Assembly and function

Assembly
The sensor is in a stable aluminium housing, which is also available as IP54-version which is used in firefighter lifts.
The solenoids are flat solenoids with 15mmx7mm of cross-section and a variable length. The solenoids are installed at the button of the arrester rails.
Function
In the iMS45 are 4 solenoid sensors, which are measuring the strengh and polarity of the magnetic field. An analysis unit detect the respective switching signals and send these serial to the cabine, respectively to the drive (driving wheel) for controlling/ stearing. Additionally the iMS45-POS have an independent transistor output for e.g. contacting a chanel of a security circuit.
different detections:
* Single magnet north
* Single magnet south
* Doubble magnet upper north/ lower south
* Doubble magnet upper south/ lower north
* Tripple magnet north in the middle
* Tripple magnet south in the middle
* Crossing direction
* Crossing speed
* North/south transition is detected exactly of each milimeter, mostlikely independent on the distace sensor/ magnet

Overview of correct signal inputs on the SM01 (LEDs)

The inputs of the shaft signals on the SM01 are signalized with LEDs. This signals will be send from the POS- Sensor in serial mode to the drive monitor. The drive monitor PCB transfers the serial signals parallel to the SM01 inputs. Following diagram shows:

-Lift in bottom levelled position (KU is active)
-Lift in levelled position outside of final floor (KU, KO not active)
-Lift in top levelled postion (KO is active)

Lift in bottom levelled position (KU is active)

Input	X3	X4	X5	X6	X7	X8	X9	X10
LED of SM01			●	●	●		●	●
input of SM01 set as	-	-	*	*	*	*	-	-

Lift in levelled position outside of final floor (KU, KO not active)

Input	X3	X4	X5	X6	X7	X8	X9	X10
LED of SM01			●	●	●	●	●	●
input of SM01 set as	-	-	*	*	*	*	-	-

Lift in top levelled postion (KO is active)

Input	X3	X4	X5	X6	X7	X8	X9	X10
LED of SM01			●	●		●	●	●
input of SM01 set as	-	-	*	*	*	*	-	-

X3: up limit switch (only used if V>2m/s or shortfloor)
X4: down limit switch (only used if V>2m/s or shortfloor)
X5: inspection limit top
X6: inspection limit bottom
X7: slowdown switch up
X8: slowdown switch down
X9: up levelling
X10: down levelling

X3 (North magnet short) and X4 (South magnet short) are additional slowdown switches whitch are only used if the floor distance is <1,6m inside the up- or down limit switches. Nomaly this inputs are not needed.

These abovementioned signals must be exactly given from the drive monitor. Otherwise no learntrip is possible.

12.Security

	.name	.date	Safety-Loop	No
.created	M.Aicher	29.10.2009		
last modif.	M.Aicher	07.01.2010		Page 03 — Vers. 1
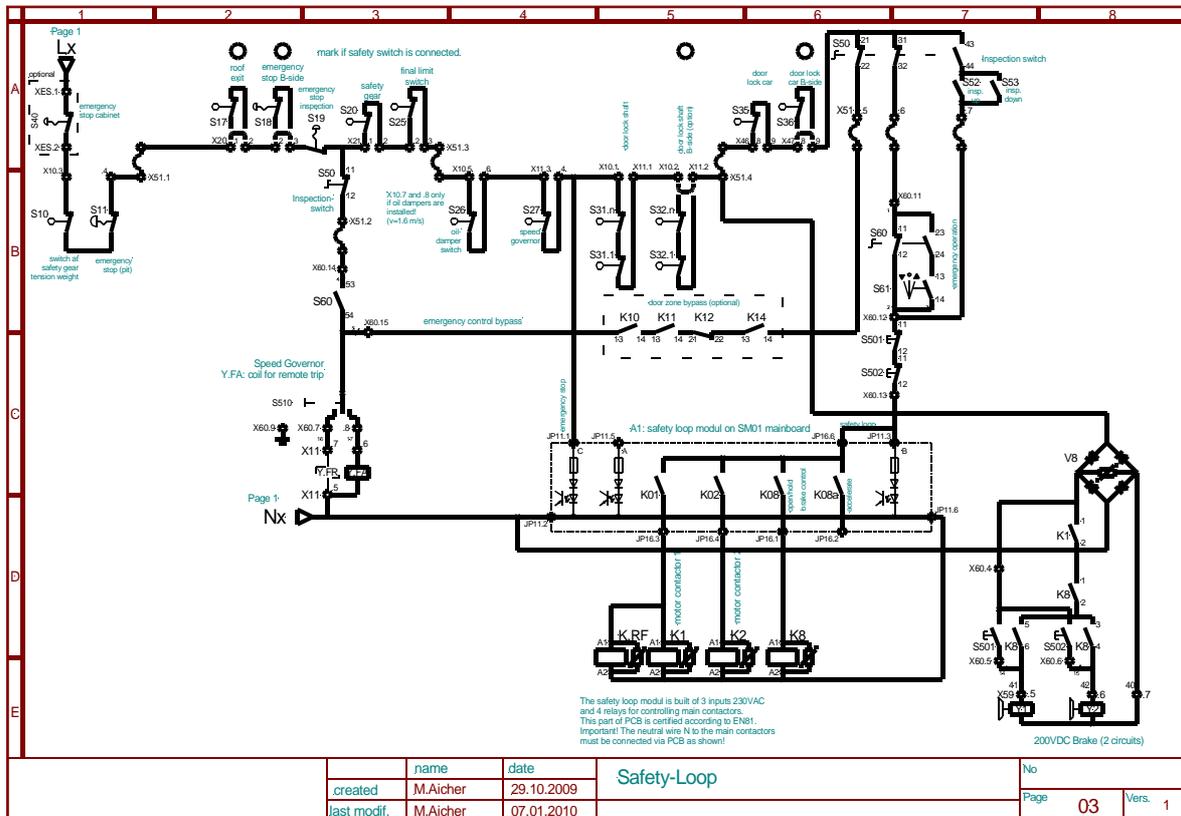

Security circuit

The safety circuit always builded up in the same way and is devided into 3 sections for security switches:

Emergency stop — contains all security switches, which are always activ, thus never are allowed to be by-passed. This affects all emergency stop switches, the counterweight switch, maintenace openings, etc.

emergency control bypass — contains all security switches, which get by-passed in return motion control, thus safty gear, emergency-end-switch, speed restrictor.

doorzonenbypass — contains all blocking switches of the shaft doors and the door contacts of the cabin doors.

At the end of the security circuit conditioned the inspections- and return motion control.

Optional security switch

In the connection scheme all popular security switches drawn in. Security switches which are not always necessary, like blocking switch of the B-door, are drawn in as optional. If it is availble it have to be marked on the connection scheme and certainly also connected.

The terminals for optional security switches are factory-provided by-passed with wire-bridge. So it is secured, that the bridge get removed by connection of a switch**.**

Matter: **By-passing of security circuits!**
Basically it is not allowed to make security circuits effectless per by-passing.
But it is not possible to install a lift without by-passing temporary parts of the security circuits.
**Only use wire-bridges for by-passing, which you install at the terminals for the security switches.**
With this handling in any case the bridge will be removed when you install the switch. Never use
shorting plug bridges – you might forget these conventionally! As wire, please use an eye-catching
one, but not the greenyellow colored one! Please also avoid to have these too long (they should not
loll out of the cabinet – in worst case somebody is closing the door and you may have 230V of the
**Security circuit at the cabinet).**

Security circuit

The security circuit is only needed, if re-levelling with open or pre-operating doors is required! For hydraulic lifts is due to the re-levelling the security circuit mandantory!

The assignment of the security circuit are two sensors, which are operating independent one from the other, to recognize where the door zones are, to compare the datas and respectivley make it possible to by-pass the door contacts within the door zones or not. For instance it should be attained the security of a castor security switch.

The security circuit is based on the common principle of the strip circuit. Every circuit switch part have to change it´s attitude in order to make an alliance possible.

The used security circuit is on a seperate board and is type-examination tested.
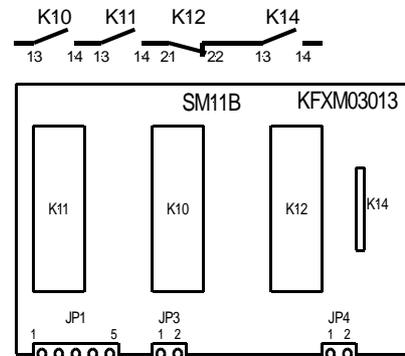

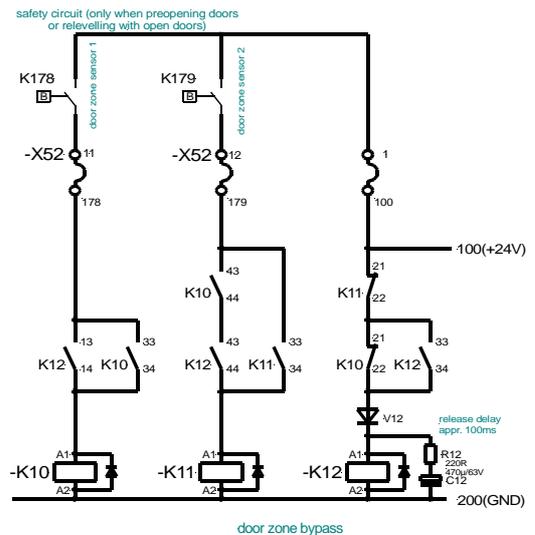

Components

K10, K11 und K12 are contactor or security-relays with **restrainet - guided** contacts. If a closer bonds, the opener stay open and contrariwise.

K10	allocated to the sensor B178 of door zone 1
K11	allocated to the sensor B179 of door zone 2
K12	monitoring of K10/B178 and K11/B 179
K14	relay without security function, allows the controller the disconnection of the bypass.
S 50	security contact in the inspections switch avoid bypassing during inspection.

Functionality:

Initial position:	Lift outside of the doorzone, K10 and K11 dropped-out, K12 tightened.
Lift runs in door zone:	B178 (K178) and B179 (K179) get closed successive or simultaneous. First K10, than K11 activates. K12 drop-out after activation of K11.➔ by-pass completed. R12 and C12 delay the depression of K12 for max. 100ms, in order to make lock

K11 possible.

Lift is leaving door zone: B178 (K178) and B179 (K179)opens, K10 and K11 depresses, K12 activate. The circuit is ready for the next switching cycle.

Possible sources of error:

Error	Simulation	Action at early opening door (door opens in doorzone)
B178 discontinued/K10 no activation	Pinch off B178 or X52.11	No hand-off. Lift stops in door zone
B179 discontinued/K11 no activation	Pinch off B179 or X52.12	No hand-off. Lift stops in door zone
B178 hot-wired/K10 do not depress	While leaving door zone, bridge K178 or bridge X52.11 with X52.1	While leaving the door zone K11 is depressing, K12 do not activate anymore. At the next run-in K11 is not activating anymore. Lift make stop by open the door➜ emergency stop
B179 hot-wired/K11 do not depress	While leaving door zone, bridge K179 or bridge X52.12 with X52.1	While leaving the door zone K10 is depressing, K12 do not activate anymore. At the next run-in K10 is not activationg anymore. Lift makes stop by open the door➜ emergency stop

According to EN81 14.1.1 one single error do not lead to a dangerous operating conditon and will be recognized, as the lift will make an emergency stop by disconnecting the security circuit while opening the door within a door zone.

In addition there is existing a further monitoring done by the controller.

Dependent up on the re-levelling sensors, which are independent from the door zone sensors, K14 is activated.

In the unlikely case, that both door-zone-sensors by leaving the door zone would be hot-wired, a by-pass outside of the door zone will be avoided by the circuit via K14.

Additional monitoring by controller

The controller is monitoring via K10, K11, and K12 the security circuit. During the journey the contact chain have to be closed once inside the door zone and have to be opend once outside the door zone. In case of an error, the installation will be shut down at the next stop with error message. Part of encoder

Scan control at security circuit

On the board SM01 F5021 there are 3 inputs for 230V. These are installed according to the requirements of EN81 at scan controls for security circuits. This is confrimed by TÜV with a confirmation assessment.

Basically the circuit consist of pre-resistors, protection diodes and optocoupler with VDE-approbation.

It is executed the terms accourding to EN81 for a secure disconnection of the 230VAC-page from the 24VDC-page as well as for exclusion of errors.

N-Wire

The N-wire of the security contactor , means motor contactor K1 and K2, as well the break contactor K8 and maybe K8a have to be controlled via the board!

At a N-wire-breakage the contactor than have the necessity of drop-out, independent of the theoretical possible chance of a hot-wire in the optocouplers which may make a partial by-pass of the security circuit possible.

Check:

Connect the controller free of voltage!

With the continuity checker between N-input terminal and A2 (N-terminal) of security contactor (K1, K2, K3, K8), check the run.

With a pluged JP12(main board) you have a run, with pultruded JP11 there must not be any run..

Pilot relay

On the board SM01sup (F5021) there are also 4 pilot relays for security contactors . This part of circuit is also confirmation checked, means it is possible to connect directly the end of the security circle, the security contactore sources their controller voltage directly out of the security circle.

The security contactors, motor contactors K1 and K2, as well the break contactor K8 are seperatly monitored. If there is one of the contactors is not depressed before a journey, the control get´s blocked and have tho be reseted manually.

Monitoring of journey

SmartCom F5021 is monitoring via the encoder of the engine and the re-levelling-sensons the reaktions of the lift in regards on the driving commands to the inverter. If there are signals missing, the drive get´s shut-down, latest after 20sec. .

Restart of journey only possible after reset of the main board.

Check:

1. Advise the lift to drive from the lowest to the topmost stop and do the unplug JP7 respectively JP8 (Encoder-inputs) at the main board. The lift have to be shut dwon after arround 20 sec.

2. Uninstall 170 or 171 (re-levelling-sensors). After arround 20sec. re-levelling the lift get shut dwon.

   You easily can set diving commands via the status window "Call.Func".

   For short lifts 20sec. may be a long time frame. In this case you could reduce temporarily the parameter "Monitoring of journey" via the menu "parameter-group F" in order to simplify the checking.

Subsidiary advises for inspection:

Lift controller of STEP Sigriner Elektronik GmbH are manufactured and checked with EN81 and VDE-standards. The used components, especially the main- and auxiliary contactore are selected respectively to the requirements of EN81, VDE0100, VDE0660.

All adjustable components, like engine-security-switch, frequency inverter etc. are allready pre-adjusted by us as far as possible. It is incumbent upon the installing company to adjust these components before implementation with respect to the resources..

By default the security cycle is fused with a power protection switch with F2 (2A Charakteristik C). As a maximum a power protection switch with 4A can be used.

gernerally:

Keep door closed: In order to be able to check without any interruption, it is possible to block the door in the menu under subtitle Test Run and under subtitle Reg it is possible to make calls.

Inspection travel:	always has priority before return motion and is also possible with activated return motion control. The by-pass of the security switch is raised. With reaching the correction switch above or below, the speed is reduced. At the inspections-end-switch will be stopped. Inside of the door zone the function of the door can be checked with "door open/close". Otherwise during inspection the door is always closed. If there are problems with non connected door swirches during installation, than disconnect the CAN- Bus Plug JP4 from SM01.
Retrun motion drive:	this is only possible with deactivated inspection control. Appropriate security switches, like emergency-end-switch, arrester-switch etc. will be by-passed. Also the return-motion-drive is stopped at the inspection-end-switches. These have to be by-passed for testing the driving-ability.
Cabin light:	If blackout of cabin light (simulation with F02) the lift will be shut down in the next stop and the door will be opened.
Temperature of engine:	A PTC thermistor switch-off leads as well to a shut down in the next possible stop.

Isolation measurement:

By default the controller undergo a isolation masurement in the factory. The at face arranged measurement refers only to the connected resources of the lift.

Absolutely consider the valid security instruction for at face isolation measurement. There is a danger for humans and technique!

In order to avoid damages of the controller, switch off the respective fuse F2 at the controller for measurements.

Connection of frequency inverter, USV-systems and other systems with power semiconductors and filter, most likely have to be disconnected or hot-wired according to manufactures for testing purpose. For this follow the advises of the manufactures.

Incorrect done isolation measurement can lead to extensive damage. In this case STEP Sigriner Elektronik Gmbh explicit do not guarantee!

13.Triggering of frequency inverter

SmartCom have 2 kinds of triggering a frequency inverter available:

1. Analog: The converter is triggered via the analog output. The travel curve at this will be created by the controller, whereby direct drive-in makes possible with every converter with analog input.

2. Multistep binary: The converter provides dependent of 3 binary signals, up to 6 steps of driving. The travel cycle mostly defined by the converter.Direct drive-in is not possible. Through ideal choice of speed, it is however possible to reach minimal creep ways. Binary triggering is for most of the industry converters possible.

Generally

Before start of a journey for all controllers the erroroutput and the ready message of the converter have to be inactive, also all security contactors (K1, K2, K8) have to be depressed. First of all, after a driving command the main contactors K1 and K2 will be activated. Via the feedback (contactor monitoring) SmartCom is checking the activation. If this is effective, the conrol of the converter will be activated. Now a RUN-signal is happen from the converter to the control. After that the break is opening. The triggering of the contactore always have to be happen from the controller, as otherwise the timing of the contactor monitoring would not work.

If you buy the controller completly with converter or provide the converter, it will be pre-programmed and adjusted with intelligent values at our testbed. Than the normal case you just need to do at face adapting the motor datas and maybe have to do a auto-tuning.

Triggering Multistep binary

At nearly all industrie-converters it is possible to choose more speeds binary, means e.g. with 3 control cables it is possible to choose 8 speed variants.

Smartcom is using 3 cables for choosing 6 speeds. Based on this the travel characteristics could be better optimazed. V1 to V3 intended as follows:

V1: Journey from floor to floor

V2: Journey with a floor in between

V3: Journey with more than one floor in between

In the normal case V1 is enough, but for fast lifts (V>1,6m/s) or for short stops V1 is needed for Journey from floor to floor, V2 for long-distance journey. For lifts faster than that (>3m/s) V3 come into the play.

The proper breaking distances are setted at the encoder with the speeds, high- respectively lowruntimes and roundings (S-curve). Which speed is choosen by the controller depends on the respective prameters in the controller (F6-F11).

Multi step 1	Multi step 2	Multi Step 3		e.g. Parameter Yaskawa
Y13	Y14	Y15	speed	
0	0	0	Stop	D1-01
1	1	0	re-levelling	D1-04
0	0	1	Insp./Learntrip	D1-05
1	0	1	V1/Single Fl.	D1-06
0	1	1	V2/Double Fl.	D1-07
1	1	1	V3/Multi Fl.	D1-08

Travel cycle

Speeds and breaking distances

Out of the lift datas result the frequenzes which have to be setted up at the encoder: $f = v \bullet \dfrac{f_{Nenn}}{v_{Nenn}}$

For a lift with 1m/s with 50Hz the inspection speed 12,5Hz have to be setted, if 0,25m/s are desired.

The braking distance results out of the desired delay, of the speed and of the rounding.

Approximately we forget about the rounding off and act on the assumption of a middle delay.

The time for the looping floor results out of "Vnenn" and "a" as follows: $T = \dfrac{v_{Nenn}}{a}$

With a deceleration of 0.5m/s²it results a down delay of 2s.

In thes time the lift runs $s = 0,5 \bullet v_{Nenn} \bullet T$

For 1m/s and 2s results a brakedistance of 1m.
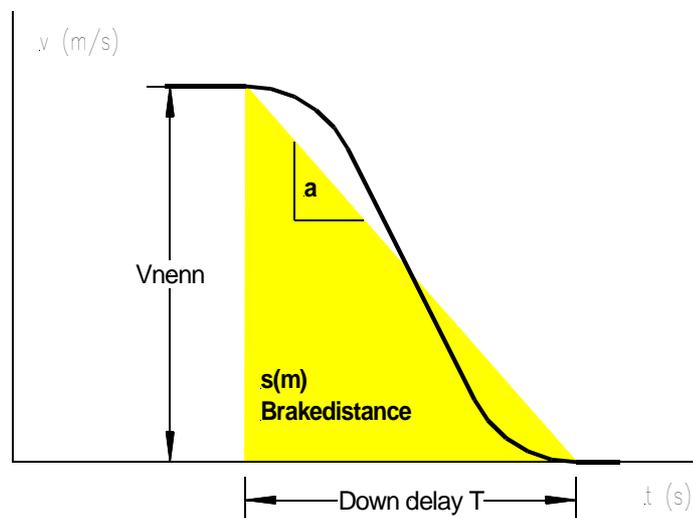

14.Parameter list

No.	Marking	Description	Stand.	Area	Unit	Value
F0	acceleration	acceleration	550	200～1500	mm/s2	0.55m/s2
F1	deceleration	deceleration	550	200～1500	mm/s2	0.55m/s2
F2	S Jerk T0	Rounding off at start	1300	100～4000	ms	1.300s

F56	Leveling adjustment up	Fine settup for stop upwards: 50 for direct drive-in, >100 with creep drive	50	0～200	mm	50mm
		V0 shut down delay upwards. (at Hydraulic with solenoid switch)	0	0～50	0.1s	
F57	Leveling adjustment down	Fine settup for stop downwards: 50 for direct drive-in, >100 with creep drive	50	0～200	mm	50mm
		V0 shut down delay downwards. (at Hydraulic with solenoid switch)	0	0～50	0.1s	
F58	Speed curve delay at start	Delay between FU Run signal and start of driving cycle	5	0～50	0.1s	0.5s
F59	Spare	Buffer				
F60	Motor contactor 1 detection mode	Engine contactor arrangement: K1 can be positioned before und behind the encoder, K2 is always behind the encoder and always controlled. 0: Engine contactor K1 before FU without monitoring.; 1: Engine contactor K1 before FU with monitoring; 2: Engine contactor K1 behind FU without monitoring 3: Engine contactor K1 behind FU with monitoring	3	0～3		
F61	Gong Output distance	Distance before floor for triggering the gongs	1200	0～1500	mm	1200mm
F62	Traval time limit	time for travel-time-controlling	32	2～45	s	32s
F63	Multi-speed setting	Number of travel steps at Multistep-control of the FU	2	1～5		
F64	Inspection allowed door operate	Approval of door movements at inspection 0 : doors blocked 1 : doors enabled	1	0～1		
F65～ F112	Indication of floors	Configuration of the displays (display codes) for the floors 1-48		0～255		

No.	Marking	Description	Stand.	Area	Unit	Value
F113~ F114	Spare	Buffer				
F115	Door close time limit	Door run time close (in case of no end-switch)	15	5～30	s	15s
F116	Door open time limit	Door run time open (in case of no end-switch)	15	5～30	s	15s
F117	Holding time	Door-open time frame after pushing the keep-door-open-button.	60	0～255	s	60s
F118	Holding time for the handicapped	Door-open time frame after pushing the keep-door-open-button for disabled person.	30	0～255	s	30s
F119	Priority Mode	Door mode if priority inside 0 : Hold door close button for closing the door 1 : Door make close after command	0			
F120	Number of registrations an-nuisance	Violation detection interior call 0 : no function 1 : Stop without erasing light grid command 2～20 : max. Number of accepted commands at the same time when empty load TX7 (cabin empty) is active.	1	0～20		
F121	Forced door-closing enable	Door scrambling: 0 : off, 1 : on	0	0～1		
F122	Run enable delay	Time between break off and FU drive signal off (speed and direction).	3	0～100	0.1s	0.3s
F123	Call classification	Type of existing exterior-calls 0 : only simple calls (not selective) 1 : Selective doors: SM-04 address 49~96 for B-door exterior-calls. 2 : calls for disabled persons: SM-04 address 49~96 for disabled person exterior-call (priority). 3 : Selective door and disabled-person-calls: SM-04 address 33~64 for B-door calls, 65~96 for disabled person-calls (priority). 4 : One- Button call function (No directional collection)	0	0~3		
F124	VIP Delay	VIP- Function or hall priority 0: hall priority >0: VIP delay time	0	0~100	1s	
F125	releveling times	Number of failed tries of re-levelling until malfunction is displayed.	0	0～5		
F126	Short floor deceleration distance	Short travel delay distance	300		mm	300mm

No.	Marking	Description	Stand.	Area	Unit	Value
F127	deceleration switch distance detect	Monitoring the distance of the delay switches before terminal stops (in case of to short) 0 : no 1 : yes	0	0～1		
F128	Front and rear door operate mode	Door mode at two doors 0 : selective door control active 1 : both doors controlled together 2 : lock function 3 : Two- user mode	0	0～1		
F129	Relevelling with door open and/or pre-open door Enable	re-levelling with open door/ prerunning door opening (requires security circuit): 0 : no security circuit 1 : prerunning door 2 : re-levelling with open door 3 : both	0	0～7		
F130	Holding door-opening/closing torque.	Door triggering (keep close/open): 0 : no close/open-keeping Bit 1 : door open-keeping (in case cabin door is pulled by the shaft door) Bit 2 : door close-keeping (in case tie bolt opens without keep-close-moment) Bit 3 : keep close during the journey (in case tie bolt bangs against the locking bolt) Bit 4 : no door-close-end-switch Bit 5 : AT120 door control Bit 6 : revolving Hall door Bit 7 : revolving door Bit 8 : magnetic doorlock controlled over Y9 Bit 9 : no-door-open-end-switch Bit 10 ON: Ret. Cam off with door open signal 　　　　OFF: Ret. Cam off if car door completely open.	0	0～65535		
F131	block floor NO.	blockable floors 0: not active 1～64: number of the floor which have to be blocked.	0	0～64		
F132	block floor start time	Time at which the floor <F131> should be closed: e.g. 730 for 7:30 o´clock	0	0～65535		
F133	block floor end time	Time at which the floor <F131> should be released. e.g.: 930 for 9:30 o`clock	0	0～65535		
F134	Compulsory Stop Floor 1	floor with forced stop (by crossing the lift is stopping mandatory, also without a call) Bit mask for floors 1－16	0	0～65534		
F135	Compulsory Stop Floor 2	Bit mask for floors 17－32	0	0～65535		

No.	Marking	Description	Stand.	Area	Unit	Value
F136	Compulsory Stop Floor 3	Bit mask for floors 33－48	0	0～65535		
F137	NS-SW Floor 1	Defines floors, which can be blocked with a key-switch: Bit mask 1-16	65535	0～65535		
F138	NS-SW Floor 2	Bit mask 17-32	65535	0～65535		
F139	NS-SW Floor 3	Bit mask 33-48	65535	0～65535		
F140	Alone door zone	Second door zone active at door open: 0：X9/X10 configures door opening. 1：X18 configures door opening.	0	0～1		
F141	Motor contactor off delay	Caster time of engine contactore : approval off=>contactore off.	5	5～100	0.1s	0.5s
F142	door open/close delay	Caster time of the door engine contactore (after activation of the end-switch)	1	0～10	0.1s	0.1s
F143	Spare	Buffer				
F144	Enable off delay	Caster FU-approval after deactivation of the direction signals.	0	0～100	0.1s	
F145	Spare	Buffer	2			
F146	Spare	Release the scan of SM02	1	Have to be "0"!		0
F147	Spare	Buffer	0			
F148	Valid Period password	PIN for run-time-bound	0	0～65535		
F149	Valid Period mode	0: no run-time-bound 1: approval till date 2: approval for run-time-hours 3:	0	0～3		
F150	Valid Period time 1	Number of year (F149=1) e.g. F150=10 => 2010	0	0～99		
		Number of run-time-hours if <149=2>	0	0～65535		
F151	Valid Period time 2	Month and day if <F149=1> e.g. 531 mean 31st may	0	0～1231		
		F149 = multiplier for F150	0	0～65535		
F152	Fan & light Delay	Caster time for cabin light/ fan after the last travel	180	0～65535	s	180s
F153	Spare	Buffer				
F154	Short Floor	Definition of the short drive floors at hydraulic with solenoid switch	0	0～65535		Bitmask
F155	Spare	Buffer				
F156	Safety loop type	Safetyloop monitoring 0: with add. Relays over X13 1:Standard	1	0~1		
F157	V4 Dec.distance	Breaking distance for V4 at 4 floors drive (at fast lifts)	5500	1500～65535	mm	5.500m

No.	Marking	Description	Stand.	Area	Unit	Value
F158	V5 Dec.distance	Breaking distance for V5 at 5 floors drivefahrt (fast lifts)	6500	1500~65535	mm	6.500m
F159	Spare	Buffer				
F160	Cancel Call model	call liquidation Bit 1: Doubble klick on interior-commands liquids all calls. Bit 2: Doubble klick on exterior-commands liquids all calls Bit 3: Violation detection	1	0~7		
F161	Block floor during time	Blocking of floors (F137,F138,F139) 0: no blocking 1: block with time F132/133 2: blocking with key-switch	0	0~1		
F162	Spare	Buffer				
F163	OEPS Running	Operation with emergency-power-supply 0: no 1: possible	0	0~1		
F164	Load device type	Type of load-measure-equipment and load-compensation at FU start. 0: Load measurement via CAN-Bus, over-load and full-load-switch via the cabine module, load-compensation calculated by the main module. 1: Load measurement and -compensation via CAN-Bus, over load and full load calculated by the main module. 2: Loadmeasurement and -compensation via CAN-Bus, over load- and full load switch via the cabin module. 3: Load measurement via CAN-Bus, over load, full load, load compensation calculated by the main board	2	0~3		
F165	Door open selection.	Door open functionality: Bit 1: no open/close during inspection. Bit 2: no opening of the door during test-operation Bit 3: door A basic position open at main stop Bit 4: door A basic position open at every stop Bit 5: door B basic position open at main stop Bit 6: door B basic position open at every stop	0	0~65535		
F166~167	Spare	Buffer				

No.	Marking	Description	Stand.	Area	Unit	Value
F168	Lift numbering for IC card service	RFID card reader 0: no RFID card reader 1~255 adress of the lift	0	0～255		
F169	Setting landings for up/down calls by IC card	RFID card reader generates 0- downwards calls 1- upwards calls	0	0～1		
F170	IC card service floor 1	Floors which are only approved with RFID: Bit mask Interior calls 1~16	0	0～65535		
F171	IC card service floor 2	Floors wich are only approved with RFID: Bit mask interior calls 17~32	0	0～65535		
F172	IC card service floor 3	Floors wich are only approved with RFID: Bit mask interior calls 33~48	0	0～65535		
F173~F174	Spare	Buffer				
F175	Creeping speed at start	Start of creep speed also see F186	6	0～100	mm/s	0.006m/s
F176~F179	Spare	Buffer				
F180	Speed Gain	Assignment of the nominal speed of the lift with top values of the analog outputs. 50.0% - 150.0%, standard 100%	1000	500～1500	0.1%	100.0%
F181	Group Lift No.	Number of the lift within a group: smallest number have highest priority (F32=3)	0	0～7		
F182	Steps of speed reduction switches	Number of driving-steps, which are used for stopping (only at Multistep-control)	2	1～4		1
F183	Speed at self-learning for Analog	Speed at reference journey (only analog-control)	800	100～800	mm/s	0.800m/s
F184~F185	Spare	Buffer				
F186	Creeping time at start	Time of creeping at start also see F175	50	0～1000	10ms	0.50s
F187	Monitor state	Status Monitoring 0 : Journey counter 1 : Malfunction of encoder 2 : CAN-Bus Rx malfunctions 3 : CAN-Bus Tx malfunctions 4 : CAN-Bus Error-Resets/sec 5 : Duplex Rx-Error 6 : Duplex Tx Error 7 : Duplex Error Resets/sec	0	0～7		
F188	Spare	Buffer				
F189	Spare	Buffer				
F190	Service floor setting 4	Floor approval bit mask 49-64	65535	0～65535		

No.	Marking	Description	Stand.	Area	Unit	Value
F191	Front door-open allowed 4	Door A approval bit mask 49-64	65535	0～65535		
F192	Rear door-open allowed 4	Door B approval bit mask 49-64	0	0～65535		
F193	Empty-load compensation at lowest landing	Empty load-compensation at lowest floor	0	1～1000	%%	0.0%
F194	Full-load compensation at lowest landing	Full-load-compensation at lowest floor	0	1～1000	%%	0.0%
F195	Full-load compensation at top landing	Full load-compensation in topmost floor	0	1～1000	%%	0.0%
F196	2nd main landing by duplex control	2. main stop at Duplex	1	1～48		
F197	3rd main landing by duplex control	3. main stop at Duplex	1	1～48		
F198	Spare	Buffer				
F199	NS-SW Floor 4	Blockable floors bit maks 49-64	65535	0～65535		65535
F200	limited distance in inspection mode	Virtual inspections-end-switch (mm before topmost stop)	0		mm	0
F201	Inspection move for limit switch active	Movements of the cabin moreover the inspection-end-positions (test end-switch and driving ability) 0 : no 1 : relesed	0			0
F202	Button beep and flicker enable	Enabling button Piep and flick of call buttons: Bit 1: button-Piep Bit 2 : flickering ot the interior calls at arrival at the aimed floor Bit 3 : flickering of the exterior calls at arrival Bit 4 : Piep at crossing floors (e.g. for blind persons)	`0	0～15		0
F203	Brightness of button normally	Brightness of the indicators for interior- and exterior calls if not indicated: The low-order 4 bits define the brightness of the external indicators, the more significant 4 bits the brightness of the internal indicators. There are 9 steps of brightness: e.g. Hex 0x11 = Dez 17 defines as well inside, as outside indicators a basic brightness of 12,5% the full brightness (if indicator active) function is also common as dual-illumination.	0			0

No.	Marking	Description	Stand.	Area	Unit	Value
F204	Relevel check	Number of allowed errors of the safty circuit adjustable, before lift controller blocked. Adjust 1~10 from one error to ten errors. By technic check set the Parameter F204 to „1" !	1	1~10		
F205	Evacuation mode	Different evacuation modes: 0:Evacuation dependent on the weight 1: Evacuation in the nearest stop (independent of weight and direction) 2:Evacuation in a defined floor (In parameter F206 adjust the evacuation floor) 3: Evacuation direction depends on an input (e.g. X21=on → Evac. Down direct., X21=off → Evac. Up direct.) to the next floor.	0	0~2		
F206	Evacuation floor	Evacuation floor if parameter F205=2	1	1~48		
F207	TAXI control	Taxi control: F207=1 activates the TAXI control function	0	0~1		
F208	Inspection to Normalmode	F208=1 Switch back from inspection to normal mode needs an acknowledge over LCD button F208=0 No acknowledge needed	0	0~1		
F209	Flat Func. Fl.	Flat drive mode for floor 1~16 (special for austria)	0	0~65535		
F210	Flat. Func. Dis.	Set maximum drive distance in flat drive mode.If Input TX18 is active than the lift drives this distance in the floors setted in F210. (Only for Austria)	0	0~500	mm	
F211	Sleepfunction	Adjust time until sleepmode will be activatet. (Only with add. pcb) Attention: (Sleepmode = T at F152 + T at F211) 0 = No sleepmode	0	0~65535	sec	
F212	Warm up drive	Lift starts warm up drive after a time after the last drive. (Only for hydraulics lifts)	0	0~65535	sec	
F211~ F230	Spare	Buffer				
F231	Heavy up demand and heavy down traffic	Enable function building fill-up/clear 0: no function 1: building fill-up 2: clean building 3: both functions	0	3		
F232	Heavy up demand start time	Start time for buliding fill-up: e.g. 730 means 7:30 o´clock	730	0~2359		

No.	Marking	Description	Stand.	Area	Unit	Value
F233	Heavy up demand end time	End time for building fill-up: e.g. 930 means 9:30 o´clock	930	0～2359		
F234	Heavy down traffic start time	Start time for clean builiding: e.g. 1700 means 17:00 o´clock	1700	0～2359		
F235	Heavy down traffic end time	End time for clean builiding: e.g. 1830 means 18:30 o´clock	1830	0～2359		
F236~ F239	Spare	Buffer				
F240	User-defined break open speed code	User-defined Multistep control of the frequency inverters: F24 = 0, F32 = 7	0	0～255		
F241	User-defined inspection low speed code		4	0～255		
F242	User-defined releveling speed code		4	0～255		
F243	User-defined creeping speed code		3	0～255		
F244	User-defined inspection high speed code		4	0～255		
F245	User-defined single floor speed code		5	0～255		
F246	User-defined double floor floor speed code		6	0～255		
F247	User-defined triple floor speed code		7	0～255		
F248	User-defined quadruple floor speed code		1	0～255		
F249	User-defined pentaple floor speed code		2	0～255		

15.Error codes

Code	Error display	Error	Comment
0			
1	The period of validity of maintenance is over.	Defineded attendence interval expired	No inspection travel possible if the attendence interval is expired.
02	Safety Circuit Breaks off	Security cicle open	
03	Up limit switch breaks off	upper end-switch reached	
04	Down limit switch breaks off	lower end-switch reached	
05	Door can't be opened.	Door can not be opened.	8 failure tryies of open (std. operation mode)
06	Door can't be closed.	Door can not be closed	8 failure tryies of close (std. operation mode)
07	Landing door lock is short.	Shaft door locking blot block	Door blocks 3s after door opening it´s still closed.
08	Car Board communication err.	CAN-bus connection to cabin module is jammed	No connection to the cabin module, or the closing-off resistor is not active.
09	Inverter Failure	Error inverter	input X11 shows error of the inverter
10	Up deceleration switch has errors.	Correction switch above out of order	
11	Down deceleration switch has errors.	Correction switch below out of order	
13	Terminal switch has errors.		Up/down force slow switch acts the same time as up/down limit switch more than 3 seconds, when the lift stops at door zone.
15	Terminal floor is split-level.		When the lift stops at leveling zone and terminal switch active, but the 01 board shows that it is not at terminal position.
16	Up deceleration switch installation distance is not enough	The distance of the above correction switch to the terminal end stop is not far enough	Choose the distance respective to the nominal speed.
17	Down deceleration switch installation distance is not enough	The distance of the below correction switch to the terminal end stop is not far enough	Choose the distance respective to the nominal speed.
18	Attached door lock detection input has error.	Anti surf input in the floor active. (door monitoring)	X24 is active, but SM04 Antisurf door monitoring reports error (SM-04 /JP10.7)
19	Door open limit and closed limit acts at the same time	Both door endswitch are active at the same time	TX0 and TX1 respectively TX11 and TX12 are active at the same time.
20	Running time restriction failure	Run time monitoring have triggered	Lift travels longer than adjusted time in F62 without changing door/flush positioning signal

Code	Error display	Error	Comment
21	Motor overheat protection	Motor overheated	PTC input more than 2 sec active.
22	The lift runs in reverse	Current direction is not according to the triggered direction.	Encoder signal in wrong direction in standard mode at more than 0,15m/s.
23	The lift is over speed.	Lift is driving to fast. Excess speed	Multistep mode: After 1,5sec delay the speed is still at 0,2m/s. Analog mode: As is-speed is 25% above the desired speed. As is-speed is more than 8% higher as the nominal speed. Speed at drive-in into the door zone is above the drive-in speed limit warning.
24	The lift is under-speed.	Under speed	Multistep: after 3s still below 50mm/s. Analog-mode: Lift is 50% slower than the desired speed.
25	Ground floor and service floor setting are wrong.	Buliding ground floor and service floor can not be reached, because floors are blocked.	floor=1 : Ground floor blocked respectivly door side blocked. floor=2 : Fire stop is a blocked floor. floor=3 : Fire stop door A is blocked. floor=4 : Less than 2 floors are enabled (check F29)
26	Car illumination failure	Cabine light dropped out	input TX16 active.
27	Up-leveling switch failure	re-levelling up sensor out of order	
28	Down-leveling switch failure	re-levelling down sensor out of order	
29	Machine room temperature sensor failure.	Temerature monitoring machine room active	X21 active
30	Leveling error +/-180mm	Actual leveling position is more than +/- 180mm wrong as safed during learn trip.	Position of levelling magnet is changed during last learntrip. → new learntrip is needed
31	The lift is slippage failure	Engine is suddenly rotating	Encoder reports movement despite of stop
32	Safety circuit switch is fauilure in running.	Security cycle opens during journey	e.g. due to door locking bolt
33	Door lock is short.	Door-locking bolt is by-passed!	door open end-switch reports door open, but locking bolt is closed.
34	Motor contactor 1 is failure	contactor monitoring engine contactor K1 reports error	output Y2 do not communicate with input X15.
35	Brake Contact is failure	contactor monitoring break contactor K8 reports error	output Y0 do not communicate with input X17.
36	Motor Contact 2 is	contactor monitoring engine	output Y3 do not communicate with input X16.

Code	Error display	Error	Comment
	failure	contactor K2 reports error	
37	Door lock relay detection is failure.		Door lock relay detection input is no signal, but both landing and car door lock are closed. Door lock relay detection input has signal, but either landing or car door lock is opened.
38	Brake switch failure	Break switch monitoring reports error	Break contactor active, but break do not get active, respectively breaks do not work synchron(X22,X23).
39	Safety Circuit relay contact is failure		Safety circuit input signal differ from safety circuit relay detection signal X13. look Parameter F156 (only special for asia)
40	Inverter running signal detection has errors.	Inverter enable control recognize malfunction	Break venting signal available, but no inverter run (enable) signal.
41	Auto-tuning error inverter		The auto-tuning of the inverter could not finish successful.
45	Door open with re-leveling relay contact failure		The detection with door open with re-leveling ouput and relay contact is different.
46	no door zone signal	Door zone error	no door zone signals X9, X10, X18
51	contactor monitoring K9	Valve enable Relays K9 monitoring	only for hydraulic lifts
52	soft start run- signal error	No soft start run- signal	
54	Landing and car door lock is different		The landing and car door lock have different for 3seconds.
55	low pressure		low pressure switch of hydraulic oil is active (check input X22)
57	Final limit switch det.	Final top limit switch was detected	Only for hydraulic lifts
58	Down direction single decerlation switch is installed falsely.	Correction downwards is installed incorrectly. Sequence is wrong.	switch provide wrong signals.
59	Down direction double decerlation switch is installed falsely.	Correction downwards 2 is installed incorrectly. Sequence is wrong.	
60	Down direction triple decerlation switchAufwärts is installed falsely.	Correction downwards 3 is installed incorrectly. Sequence is wrong.	
61	Down direction fourfold decerlation switch is installed falsely.	Correction downwards 4 is installed incorrectly. Sequence is wrong.	

Code	Error display	Error	Comment
62	Up direction single decerlation switch is installed falsely.	Correction upwards is installed incorrectly. Sequence is wrong.	
63	Up direction double decerlation switch is installed falsely.	Correction upwards 2 is installed incorrectly. Sequence is wrong	
64	Up direction triple decerlation switch is installed falsely.	Correction upwards 3 is installed incorrectly. Sequence is wrong	
65	Up direction fourfold decerlation switch is installed falsely.	Correction upwards 4 is installed incorrectly. Sequence is wrong.	
66	The steps of deceleration switch have errors.	Number of installed correction switches is not according to the definded parameters	
67	Leveling switches have been connected in reverse	re-levelling switches are interchanged installed.	
68	Leveling zone or leveling plate failure	Length of the flush/door zone is shorter as the distance to the stop	
69	Floor err in self-learning.	Number of the flush/door zones is not according to the number of floors	
70	The lift can't do self-learning	Reference journey not possible	Correction below, reference journey end -switch, or flush signal not correct at reference journey start position

16.Statuscodes

On the display you will find in the middle line on the right side a number. This is a status number which tells you the actual status of the controller.

S: Step only checked when lift is no running
N: Only checked when normal operation

No.			Meaning	Remarks
0			Start forbidden	
1			error	Switch off and on for reset
2			Safetyloop is open	
3			Doorlock is open	
4			Inverter not ready	
5			Inverter error	
6			Up limit switch activated	
7			Down limit switch activated	
8				
9	S		Waiting at landing (delay after stop at landing)	Time varies depending on door times
10	S		Motor contactor K1 not released	
11	S		Motor contactor K2 not released	
12	S		Brake contactor K8 not released	
13	S		Brake monitoring switch activated	Only if brake monitoring is active
14	S		Waiting for run-signal of inverter	
15	S		Waiting for finish saving or Reset	While saving parameters, drive is disabled
16	S	N	Overload is active	If overload sensor is OK, pls check input type (NC/NO)
17	S	N	Door zone sensor fault	
18	S	N	K14 fault (bypass safety circuit completion)	Only if safety circuit is available
19	S	N	Elevator lock active (Terminal 150)	
20		N		
21	S	N	Door lock closed but door open limit switch is active	Pls check input type (NC/NO)
22	S	N	Executing door open job	Relevelling available
23	S	N	No close door limit	
24	S	N	When making a learntrip, the controller will stop here before starting	
25	S	N	No starting because learntrip was made.	
26	S	N	Up call in present floor, direction up	
27	S	N	Down call in present floor, direction down	
28	S	N	Car call in present floor	

26	S	N	Up call in present floor, direction up	
29			If in inspection mode, no more running is allowed without running direction	Check inspection limit switches. If both active this error may occur.
30			No running direction	Waiting for command
31	S	N	Machine room overheat	
32	S	N	Light off	
33	S	N	Motor overhead (PTC) 150T

18.Declaration of conformity SM01PA/J 32bit

STEP SIGRINER Elektronik GmbH

EG – Konformitätserklärung
(gemäß EG-Richtlinie 95/16/EG)

EC – Declaration of Conformity
(EC-Directive 95/16/EG)

Wir erklären, daß	We declare that
der **Sicherheitskreismodul SKM** auf der	the **Safetyloop Module SKM**
Baugruppe **F5021B**, Leiterkarte **SM01PA/J**	on the device F5021B, PCB SM01PA/J
bestehend aus Abfrageschaltung und Vorsteuerrelais	built of safetyloop monitoring circuits and relays to control main contactors
den Anforderungen der Richtlinie des Rates zur Angleichung der Rechtsvorschriften der Mitgliedstaaten über Aufzüge (95/16/EG) entspricht.	is manufactured according to the european safety rules for elevators (95/16/EG)
Die Schaltung entspricht der EN81-1 und 2, Ausgabe 05/2000 sowie der 12. GSGV.	The safety units are according to EN81-1 and 2 (05/2000) and 12. GSGV.
Die Konformitätserklärung basiert auf der vom TÜV Nord durchgeführten Konformitätsbewertung	The declaration is based on the certification of TÜV Nord.
44 799 09 376 830 000 vom 3.12.2009	**44 799 09 376 830 000 dated 3.12.2009**
Die Baugruppe F5021B (SM01PA/J) ist der Nachfolger der Baugruppe **F5021 (MIC-SE32A, Zertifikat 44 208 06 340005 000 vom 24.08.2006)**. Geändert wurde nur der Relais-Typ.	The device F5021B (SM01PA/J) is the replacement for **F5021 (MIC-SE32A, Certificate 44 208 06 340005 000 dated 24.08.2006)**. Only modification was the type of relays.
Voraussetzung für die Gültigkeit der Erklärung ist der korrekte Einbau und Betrieb der Schaltung, gemäß der Betriebsanleitungen.	The installation and usage must be according to the actual manuals of SmartCom II controller.
Die Erklärung erfolgt durch:	The declaration is done by:

Certificate of Conformity
to a Type Examination

Registred No.: 44 799 09 376830 000

(1)	**Product, Type:**	Interface module SKM on printed circuit board SM01PA/J:
		Interfaces to the lift control and monitoring inputs for the safety chain
(2)	**Manufacturer:**	STEP Sigriner Elektronik GmbH
		Martin-Moser-Str. 15, D-84503 Altötting
(3)	**Bearer of the Certificate:**	Shanghai STEP Electric Co. Ltd.
		No.289 Xinqin Road
		Jiading District 201802
		Shanghai, China
(4)	**Date of application:**	16.11.2009
(5)	**EC Directive:**	Lift Directive 95/16/EG
(6)	**Testing laboratory:**	TÜV NORD CERT GmbH, Prüflabor Produktsicherheit
(7)	**Test report number and date of issue:**	No. 09 799 376830 000 dated 03.12.2009
(8)	**Date of issue:**	03.12.2009
(9)	**Attached documents:**	None
(10)	**Additional information:**	Connection diagrams
	Test result:	The interfaces on printed circuit board SM01PA/J comply with the test principles.
		This Certificate of Conformity is a basis for the manufacturer's Declaration of Conformity.
	Notes:	This certificate is also a replacement for certificate no. 44 208 06 340005 000
		This Certificate of Conformity is only valid with the attached appendix (2 pages).

Hinweise zum TÜV NORD- Zertifikat

Dieses TÜV NORD - Zertifikat gilt nur für die umseitig bezeichnete Firma und das angegebene Produkt. Es kann nur von der Zertifizierungsstelle auf Dritte übertragen werden.

Notwendige Bedienungs- und Montageanweisungen müssen jedem Produkt beigefügt werden.

Jedes Produkt muss deutlich einen Hinweis auf den Hersteller oder Importeur und eine Typenbezeichnung tragen, damit die Identität des geprüften Baumusters mit den serienmäßig in den Verkehr gebrachten Produkten festgestellt werden kann.

Der Inhaber des TÜV NORD - Zertifikates ist verpflichtet, die Fertigung der Produkte laufend auf Übereinstimmung mit den Prüfbestimmungen zu überwachen und insbesondere die in den Prüfbestimmungen festgelegten oder von der Zertifizierungsstelle geforderten Kontrollprüfungen ordnungsgemäß durchzuführen.

Bei Änderungen am geprüften Produkt ist die Zertifizierungsstelle umgehend zu verständigen.

Bei Änderungen und bei befristeten Zertifikaten ist das Zertifikat nach Ablauf der Gültigkeit urschriftlich an die Zertifizierungsstelle zurückzugeben. Die Zertifizierungsstelle entscheidet, ob das Zertifikat ergänzt werden kann oder ob eine erneute Zertifizierung erforderlich ist.

Für das TÜV NORD - Zertifikat gelten außer den vorgenannten Bedingungen auch alle übrigen Bestimmungen des allgemeinen Vertrages. Es hat solange Gültigkeit, wie die Regeln der Technik gelten, die der Prüfung zu Grunde gelegt worden sind, sofern es nicht auf Grund der Bedingungen des allgemeinen Vertrages früher zurückgezogen wird.

Dieses TÜV NORD - Zertifikat verliert seine Gültigkeit und muss unverzüglich der Zertifizierungsstelle zurückgegeben werden, falls es ungültig wird oder für ungültig erklärt wird.

Hints to the TÜV NORD - Certificate

This TÜV NORD - certificate only applies to the firm stated overleaf and the specified product. It may only be transferred to third parties by the certification body.

Each product must be accompanied by the instructions which are necessary for its operation and installation.

Each product must bear a distinct indication of the manufacturer or importer and a type designation so that the identity of the tested sample maybe determined with the product launched on the market as a standard.

The bearer of the TÜV NORD - Certificate undertakes to regularly supervise the manufacturing of products for compliance with the test specifications and in particular properly carry out the checks which are stated in the specifications or required by the test laboratory.

In case of modifications of the tested product the certification body must be informed immediately.

In case of modifications and expiration of validity the original certificate must be returned to the certification body immediately. The certification body decides if the certificate can be supplemented or whether a new certification is required.

In addition to the conditions stated above, all other provisions of the General Agreement are applicable to the TÜV NORD - Certificate. It will be valid as long as the rules of technology on which the test was based are valid, unless revoked previously pursuant to the provisions of the General Agreement.

This TÜV NORD - Certificate will become invalid and shall be returned to the certification body immediately in the event that it shall expire without delay when it has expired or revoked.

Appendix to Certificate of Conformity No. 44 799 09 376830 000

TÜV NORD

(a)	**General information:**	see page 1
(b)	**Product, Type:**	Interface module SKM on printed circuit board SM01PA/J:

Interfaces to the lift control and monitoring inputs for the safety chain

Terminal JP9
Terminal JP10
Terminal JP11
Terminal JP12

The return path (N) of the safety chain must be routed via Terminal JP12.1 and Terminal JP12.1 and provides the reference ground for the monitoring input circuits.

(c)	**Pollution degree:**	3	
(d)	**Nominal voltages:**	Voltage on monitoring inputs	
		Terminal JP12	230V 50Hz
		Voltage on relay outputs	
		Terminals JP9, JP10, JP11	230V 50Hz
(e)	**Isolation between safety circuits and standard control circuits:**	According to EN81 and EN60664-1
